

Muelles

# MUELLES SPRINGS

**Los muelles que presenta  
AZOL-GAS cumplen normas  
internacionales de dimensiones  
y requerimientos.**

**Los muelles están fabricados  
por Associated Spring, y los  
servicios de diseño, estudio de  
prototipos, pruebas de muestras,  
análisis de fallos, solución de  
problemas, asistencia técnica y  
capacidad de producción están  
disponibles por medio de un  
único proveedor.**

***AZOL-GAS presented springs,  
pass the requirements and  
dimensions of international  
norms.***

***The springs are made by  
Associated Spring, and design  
service, prototype work, sample  
testing, failure analysis, problem  
solving, technical assistance and  
production capability are all  
available through a single door.***

Los muelles de troquel de Associated Spring se fabrican a partir de un hilo metálico de sección transversal desarrollado para garantizar un equilibrio óptimo entre la capacidad de carga y su duración máxima.

Nuestro proceso de producción se realiza mediante cuidadosos controles y con un equipo especial desarrollado por el equipo de investigación del Grupo Barnes.

Todas las etapas de la fabricación se efectúan bajo un estricto control de calidad, inspección y exámenes del producto para así garantizar una larga vida útil de cada uno de los muelles de troquel.

Detalles técnicos facilitados sobre demanda.

Muelles fabricados de acuerdo con la norma ISO 10243.

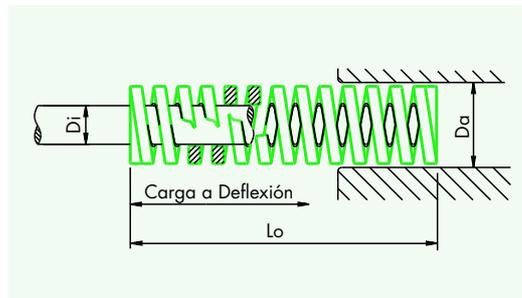

*Associated Spring Die springs are manufactured using a wire cross section developed to provide the optimum balance between load carrying characteristics and cycle life.*

*Produced under carefully controlled processes with special equipment developed by Barnes Group, Inc's research and development facilities.*

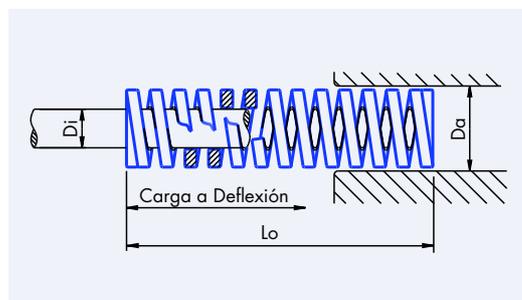

*All of the manufacturing steps are closely monitored by rigid quality controls, inspection and testing to ensure that the long service life engineered into every die spring is constant.*

*Full technical specifications available on request from Azol-Gas, S.A.*

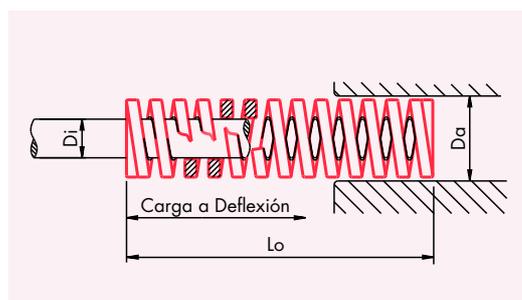

*Springs manufactured in accordance with ISO 10243.*

# Características y Ventajas Features & Benefits

## SOBRESALIENTES MATERIALES Y SECCION DE VARILLA

### CARACTERISTICAS

- Todos los muelles están fabricados en acero de aleación de cromo de alta fuerza tensora.
- Sección de varilla de comportamiento óptimo.
- Extremos de muelles aplanados.
- Disponibilidad de otros materiales para condiciones y ambientes especiales.

### VENTAJAS

- Resistencia inherente para soportar cargas pesadas.
- Sobresaliente comportamiento en aplicaciones de gran esfuerzo.
- Resistencia a temperaturas de hasta 230°C.
- Disponibilidad inmediata.
- Metalurgia cuidadosamente controlada.
- Máxima posibilidad de diseño.
- La sección de varilla proporciona una deflexión óptima frente a fallo debido a incremento brusco de la carga.
- Extremos planos para facilitar una superficie de soporte de carga máxima y segura.
- Materiales especiales disponibles para cubrir necesidades de los clientes.

## ROBUSTEZ DIMENSIONAL

### CARACTERISTICAS

- Las características dimensionales permanecen constantes e iguales de un lote de muelles a otro.

### VENTAJAS

- Asegura un comportamiento uniforme del muelle.
- Consolida ratios de medida consistentes.
- Mayor exactitud de carga a una longitud de muelle determinada.
- Garantiza que Da pueda trabajar libre en el orificio y Di sobre el vástago especificado.
- Cumplimiento de los más exigentes niveles de producción y calidad.
- Muelles íntegros y fiables.

## MAYOR DURACION

### CARACTERISTICAS

- Diseñado para aguantar con toda seguridad cargas bruscas.
- Concebido para resistir continuas deflexiones en alta cadencias.
- Granallado para prolongar la vida útil del muelle.
- Menor período de paralización del trabajo.

### VENTAJAS

- Funcionamiento fiable y seguro.
- Aumento de la vida útil del muelle en un 30%.
- Reducción de fallo o rotura del muelle.
- Comportamiento uniforme durante una mayor duración del muelle.
- Mayor rentabilidad.
- Márgenes adicionales de funcionamiento.

## DEFLEXION SUPERIOR

### CARACTERISTICAS

- Mayor carrera disponible a bloque.
- Mayor carrera en cada muelle.

### VENTAJAS

- Mejores capacidades de carga.
- Mejores prestaciones bajo condiciones límite.
- Máxima versatilidad de aplicaciones.
- Completa fiabilidad y seguridad.
- Menor longitud a bloque.

## SUPERIOR MATERIALS & WIRE PROFILE

### FEATURES

- All die springs are made from chromium alloys.
- Optimal wire cross section features a rectangular shape with rounded corners.
- Spring ends are ground square.
- Other raw materials are available for special conditions and environments.

### BENEFITS

- Inherent toughness to withstand heavy load demands.
- Superior performance in high stress applications.
- Heat resistance up to 230°C.
- Readily available, cost efficient raw material.
- Consistent controlled metallurgy.
- Offers maximum design possibilities.
- Wire cross section provides optimum deflection and protection against failure due to excessive stress build-up.
- Square ends create a reliable, flat, maximum load-bearing surface.
- Specialty materials available to meet customer requirements.

## DIMENSIONAL CONSISTENCY

### FEATURES

- Dimensional requirements remain consistent and measurably the same from one batch of spring to the next.

### BENEFITS

- More uniform spring performance.
- More consistent rate recordings.
- Greater load accuracy at a given test height.
- Certainty that OD will work freely in prescribed hole and ID will work freely over prescribed rod.
- Assurance of the highest production and quality standards.
- Reliable performance engineered.

## LONGER SPRING LIFE

### FEATURES

- Engineered to better withstand shock loading.
- Designed to endure constant high-speed deflections.
- Shot-peened to increase fatigue life.
- Less downtime.

### BENEFITS

- Reliable, trouble-free performance.
- Increased fatigue life by as much as 30 %.
- Reduced spring breakage.
- Uniform performance over a longer lifetime.
- More cost effective.
- Extra performance margins.

## EXCELLENT DEFLECTION

### FEATURES

- Mayor carrera disponible a bloque.
- More travel in each spring.

### BENEFITS

- Higher load capacities.
- Increased fatigue life.
- Greater application flexibility.
- Better, more reliable performance.
- Lower solid height.

# Seleccionar un muelle de troquel

## Selecting Die Springs

**AZOL-GAS SA**

AZOL - GAS, S.A. - c/Landallucia, 7  
Pol. Ind. Jándiz - 01015 VITORIA - GASTEIZ  
ESPAÑA / SPAIN  
Tfno.: 34 (9) 45 - 290010  
Fax: 34 (9) 45 - 290381  
E-MAIL: AZOLGAS@NEXO.ES

Una regla general que hay que tener en cuenta a la hora de elegir un muelle es la de utilizar siempre tantos muelles como vaya a albergar el troquel que producirá la carga requerida con la menor cantidad de deflexión. Esto aumentará la vida útil del muelle, reducirá las posibilidades de fallo del muelle y el tiempo perdido que resulta de esto, así como las pérdidas productivas y los costes elevados de mantenimiento.

El muelle de troquel supone un porcentaje muy pequeño del coste del troquel. Ahorrar algo de dinero en los muelles resulta una elección equivocada que puede traer a largo plazo importantes costes en tiempo perdido y mano de obra.

Cuanto más rápido trabaja un muelle, más atención hay que prestar a sus límites de fatiga. En ciclos lentos, es posible obtener buenos resultados con los muelles trabajando cerca de la deflexión máxima. A medida que aumenta la velocidad, la vida útil del muelle disminuye.

Se pueden seleccionar los muelles para desmoldadoras, prensas y otros componentes de troquel de las páginas siguientes. Cuando se selecciona un muelle de troquel hay que determinar el tipo de resultados requeridos de los muelles: recorrido corto, normal o largo. Para aplicaciones de recorridos cortos o normales, se deben utilizar las deflexiones señaladas en la columna de larga vida. Para aplicaciones de recorrido largo, se deben utilizar las de la columna de vida óptima. Las deflexiones recomendadas para cada muelle basadas en los resultados requeridos se encuentran en las páginas "MUELLES 4" a "MUELLES 11".

Otro punto que se debe tener en cuenta a la hora de seleccionar un muelle es el de considerar el número de ciclos que el troquel requiere que realice el muelle. Hay que seleccionar los muelles en función de la labor que vayan a desempeñar para que funcionen de acuerdo con la carrera requerida. Hay que calcular el número de muelles necesarios dividiendo la carga total suministrada por un muelle entre la carga total requerida. Redondear el número resultante de muelles hacia el mayor para obtener los resultados requeridos.

*A general rule to observe in spring selection is to always use as many springs as the die will accommodate which will produce the required load with the least amount of deflection. This will increase the useful life of the spring, reduce the chances of spring failure and the resulting downtime, loss of production and increased maintenance cost.*

*Die spring costs are a very small percentage of the total cost of the die. An effort to save a few cents on die springs is a misguided act that can cost many dollars in lost time and labor.*

*The more rapidly a spring works, the more attention must be paid to its fatigue limits. In slow moving dies or fixtures, it is possible to get good performance with springs operating near maximum deflection. As the working speed increases, the life expectancy of the spring at that deflection decreases.*

*Springs for strippers, pressure pads, and other die components can be selected from the following pages. When selecting a die spring it is necessary to determine the type of performance required of the spring: short, normal or long run. For short or normal run applications use the deflections tabulated in the long life columns. For long run applications use deflections based on optimum life. The recommended deflections for each spring based on the performance required are shown on pages "MUELLES 4" to "MUELLES 11".*

*Another approach when selecting a spring is to work back from the amount of operating travel the springs will be subjected to as indicated by the die layout. Select springs in the appropriate duty range which will operate efficiently at the required travel. Calculate the number of springs needed by dividing the load supplied by one spring into the total load required. Round the total number of springs to the next higher even number for balanced performance.*

# Problemas y soluciones Problems and answers

## PROBLEMAS Y SOLUCIONES

La mayoría de los problemas que aparecen en la utilización de los muelles de troquel vienen provocados por la mala aplicación de los mismos.

## FALLOS DE LOS MUELLES

Los muelles de troquel se producen bajo un control tan cuidadoso que los problemas de fabricación han prácticamente desaparecido. Los fallos de los muelles de troquel se deben bien a una mala fabricación, bien a una aplicación incorrecta de los mismos. La causa del problema reside en la utilización del muelle al límite de su elasticidad. La solución, claro está, consiste en la selección concienzuda de los muelles de troquel adecuados para cada aplicación.

## GUIA DEL MUELLE

Los muelles de troquel se fabrican con los extremos de sección transversal cuadrada, por lo que se sujetan sobre su propia base y se comprimen aún por de bajo de su carga. Existe una relación positiva entre el diámetro exterior del muelle y la longitud total, que es la que determina si el muelle corre el riesgo de deformarse o no con una carga inferior. Como norma general, si la longitud libre es cuatro veces mayor que el diámetro medio del muelle, podría producirse la deformación bajo compresión. Para solucionarlo basta con guiarlo por una cavidad o una varilla o ambas opciones. Se recomienda siempre suministrar una guía para cualquier muelle de troquel.

La figura A aporta información acerca de si un muelle específico con extremos de sección transversal cuadrada está sujeto a posibles deformaciones. La curva indica que un muelle con los extremos de sección transversal cuadrada que se comprime por ambos lados puede sufrir deformaciones si los valores caen por debajo o a la derecha de la curva.

## PROBLEMS & ANSWERS

Most problems that arise in the use of die springs usually result from improper application... failure to take advantage of and protect the features engineered into the spring.

## SPRING FAILURE

Die springs are produced under such careful controls that manufacturing problems have virtually been eliminated. Die spring failure is usually due to either poor spring design and manufacture or incorrect application of the spring. The most common problem source is the use of die springs too close to, or beyond, the springs' physical limitations. The solution, of course, lies with careful selection of die springs for each application.

Other solutions to common spring problems are as follows

## SPRING GUIDANCE

Die springs are manufactured with ends ground and squared so that they stand on their own base and compress evenly under load. There is a positive relationship between the spring's outside diameter and total length which determines whether or not a spring will buckle under load.

Generally, if the free length is more than four times the mean diameter of the spring, it could have a buckling problem under compression. This is solved by providing guidance by a pocket, a rod, or both to reduce buckling. It is always recommended to provide guidance for any die spring.

Figure A provides information as to whether a specific spring with squared, ground ends is subject to buckling. The curve indicates that buckling may occur to a squared-and-ground spring, both ends of which are compressed against parallel plates, if the values fall above and to the right of the curve.

## ORIFICIOS Y VARILLAS

Los orificios o cavidades del troquel en el que se van a insertar los muelles han de tener el tamaño que se especifica en las páginas "MUELLES 4" a "MUELLES 11". Los muelles aumentan su tamaño a medida que se comprimen. Si el orificio es de menor tamaño, existe el riesgo de que el frotamiento haga fallar al muelle antes de lo estipulado.

Los orificios también han de tener el fondo plano y las esquinas cuadradas. Esto permitirá al muelle trabajar sobre una superficie plana y aportar una tensión uniforme sobre las espiras cuando el muelle esté comprimido.

Hacer que el muelle trabaje sobre una varilla también proporciona una buena protección contra la deformación. Hay que cuidar que la varilla sea lisa. Si la varilla es más corta que el muelle, esta deberá tener un extremo pulido a fin de evitar todo contacto entre las espiras y un borde afilado.

## HOLES AND RODS

Holes or pockets provided in the die for springs must be the specified size listed on pages "MUELLES 4" to "MUELLES 11". Springs increase in diameter as they are compressed. If the hole is undersized, a wearing or binding action will produce early spring failure.

Hole also must have flat bottoms with square corners. This will allow the spring to work on a flat surface and provide uniform stress on the coils when the spring is compressed.

Working a spring over a rod also provides good protection against buckling. Care should be taken to be sure the rod is smooth. If the rod is shorter than the spring, it should have a tapered nose so that there is no danger of the spring coils coming in contact with a sharp edge.

### ALINEACION

Hay que cuidar que cualquier mecanismo que se utilice para contener o guiar el muelle esté bien alineado a ambos lados del troquel. Los orificios y las varillas que no correspondan pueden causar problemas que produzcan el fallo del muelle y que dañen la herramienta.

### TEMPERATURA

El calor es un problema que se ignora frecuentemente en el fallo del muelle o en la pérdida de carga. La temperatura máxima que puede soportar el acero al cromo de aleación es de 230°C. La figura B muestra el porcentaje de pérdida de carga atribuido a la combinación del calor y la tensión. Llama la atención el calor generado por el troquel en marcha que puede ser muy significativo en numerosas aplicaciones. El calor que absorbe la herramienta puede ser transferido a los muelles y de esta forma producirse una pérdida de carga y el fallo prematuro del muelle.

### DEFLEXION

Si se aplica una deflexión mayor a la recomendada por el fabricante se puede producir el fallo prematuro de los muelles. Compruebe la carrera de la prensa o troquel para asegurarse de la deflexión real a la que estará sometido el muelle. Si se encuentra por debajo de un límite de seguridad, deberían realizarse una serie de cambios sin demora.

### MODIFICACION DEL MUELLE

Cada uno de los muelles de troquel están diseñados para obtener una serie de resultados dentro de áreas determinadas de trabajo. La modificación de la longitud del muelle o del número de espiras, el pulido del diámetro interior o exterior o la introducción de restricciones en el movimiento de las espiras pueden causar el fallo prematuro del muelle. Intentar modificar un muelle puliendo los extremos puede cambiar el comportamiento del material y afectar negativamente al funcionamiento del muelle.

La modificación de un muelle tras su fabricación trae consigo problemas y fallos. No estropee un troquel costoso por culpa de la pequeña cantidad de dinero que se ha ahorrado en una modificación barata.

### CORROSION

Con frecuencia, los fallos del muelle se deben a elementos corrosivos. La corrosión reduce considerablemente la vida útil del muelle. Tenga cuidado con los productos que puedan modificar el muelle, tales como el óxido, los lubricantes, detergentes, productos químicos, etc. Los muelles limpios y protegidos proporcionan mejores resultados.

### ALIGNMENT

Care should be taken to make certain that whatever device is used to contain or guide the spring is properly aligned on both sides of the die. Holes or rods that do not match can cause problems that create spring failure and damage to the tool.

### TEMPERATURE

Heat is a frequently ignored factor in spring failure or load loss. The maximum rated service temperature for our chromium alloy steel is 230°C. Figure B shows the percentage of load-loss due to heat and stress combinations. Thought should be given to the heat generated by the working die which can be significant in many applications. Heat absorbed by the tool can be transferred to the springs resulting in a loss of load and premature spring failure.

### DEFLECTION

Deflection beyond the manufacturer's recommendation can cause early spring failure. Check the press or die travel to be sure of the actual deflection to which the spring will be subjected. If it is beyond a safe limit, changes should be made without delay.

### SPRING ALTERATION

Each die spring is carefully engineered to perform within specific areas of work. Altering the spring such as reducing its length or number of coils, grinding the inside or outside diameter, or placing restrictions on the movement of the coils can cause early spring failure. Trying to alter a spring by grinding down its ends can change the temper of the material and negatively affect spring performance.

Altering springs from their manufactured state almost invariably leads to problems and failure. Don't gamble an expensive die for the small amount saved on a cheap alteration.

### CORROSION

Frequently, spring failure can be traced to corrosive elements. Reduction of material or pitting of the spring will reduce its useful life. Be alert to conditions that may effect the spring's surface such as rust, lubricants, soaps, chemical, etc. Clean, protected springs give the best job performance.
